

Programming Project #4  
**Adding a Player**  
CpSc 4160/6160: Data Driven 2D Game Development  
Computer Science Division, Clemson University  
Brian Malloy, PhD  
October 18, 2017

In order to receive credit for this assignment, your solution folder must be compressed and submitted to the web handin bucket by 8 AM, Friday, November 10<sup>th</sup>, 2017. If you cannot make this deadline, you can receive 90% of the grade by submitting your assignment within three days of the due date.

For this assignment, you will begin to build a playable game with a HUD, and a player object.

1. Incorporate a `player` object into your animation (encapsulated); use `asdw` to control the player.
2. Build a HUD that is reconfigurable through modifications to your XML file. The Hud should be encapsulated in a class that you design and implement. The HUD should appear for a few seconds when the game begins, and the player should be able to toggle the HUD with F1. Your HUD should display information about how to move your player object so that the TA and I can test your game.
3. Collision detection and AI. Some of your sprites should be smart and react to the player when the player gets close. Use the observer pattern to enable the player to notify NPCs of its position.
4. Your name printed clearly (font color/size) in lower left screen. You can nuke fps if you like.
5. **video:** either (1) make your own mp4, or (2) make sure the F4 option works so that the TA can make your video; be sure to set the constant in the XML that specifies the number of frames to capture.
6. In your README for this project, include a paragraph that describes the game level that you would like to build for your final project. Provide some details about actions in the game, your sprite source, how you will keep score, and how the game will conclude.

The course repository contains examples of how to implement player movement, collision detection, and using the *observer* pattern to implement AI. Study these examples.

If you would like to work synergistically with a partner, this project can initiate your collaboration.

As you build your solution for this project, strive for proper C++, and good object oriented principles. Your goal should be to write classes that “take care of themselves.”

The Light at the End: Project #5 will entail incorporating projectiles and shooting, explosions, object pooling, sound, and music. The final project, Project #6, will require that your game reach a conclusion, and you incorporate more pizzazz. You could incorporate a menu, a health meter that appears or disappears at strategic times in the game, *Painter's Algorithm*, etc.

For the remaining projects, we will use the tracker framework and you will **not** be changing to a new framework. In addition, you may make any modifications or extensions to the tracker framework to accommodate the game that you intend to build.
